

ENDEVCO MODELS
7310A, 7330, 7360A

ANGULAR RATE AND 6DOF SENSORS

Measure it easily and accurately with
Endevco Angular Rate & 6DoF sensors

TYPICAL APPLICATIONS

- Vehicle dynamics
- Aircraft flight testing
- Spacecraft and satellite
- Missile testing
- Automotive rollover

Endevco® models 7310A & 7330 are angular rate sensors that utilize unique silicon MEMS gyroscope technologies with custom electronics and packaging, providing reliable sensing performance even under excessive shock and vibration environments. These angular rate sensors are designed for automotive safety testing and other system designs requiring accurate measurement of angular velocity.

The Model 7360A is a six degrees of freedom (6DoF) sensor that provides analog output for three axes of linear acceleration and three axes of angular rate in a compact, roughly one inch cube package. A sensor with analog output offers the advantage of being able to troubleshoot the data to its source and examine the output compared to its time history. As opposed to inertial measurement units (IMU's) where the information has been digested and presented in a take-it-or-leave-it fashion, which is not user-friendly in a test and measurement or R&D environment.

In typical dynamic measurements, acceleration and angular rate data are essential parameters needed to fully characterize the complex behavior of a moving object. Until recently, engineers could only conveniently gather information using linear accelerometers because the massive array of sensors required to collect rotational data was impractical due to the expense and space required. The Model 7360A 6DoF sensor solves this problem by providing multiple measurements with one compact sensor. Now, rather than having to make assumptions about these dynamic interactions, the 7360A provides reliable, empirical data to support the analytical results. In addition, the close proximity of all the CSM's (centers of seismic mass) allows for superior approximation of the vehicle/body dynamics. What makes the 7360A truly unique is that it offers low acceleration ranges and low angular rate ranges most suitable for accurately characterizing motion.

INERTIAL SENSORS			
			
Model Number	7310A	7330	7360A
Description	Angular rate sensor	Triaxial angular rate sensor	Six degrees of freedom (6DoF) sensor
Linear Range	±100 / ±500 / ±1,500 / ±6,000 / ±8,000 / ±12,000 / ±18,000 deg/sec		Accelerometers: ±2 / ±10 / ±50 / ±200 / ±500 g
			Angular rate sensors: ±100 / ±500 / ±1,500 / ±8,000 / ±12,000 / ±18,000 deg/sec
Sensitivity	20 / 4 / 1.333 / 0.333 / 0.25 / 0.167 / 0.111 mV/deg/sec		Accelerometers: 1000 / 200 / 40 / 10 / 4 mV/g
			Angular rate sensors: 20 / 4 / 1.333 / 0.25 / 0.167 / 0.111 mV/deg/sec
Frequency Response (Hz)	0-1000 / 0-1000 / 0-1000 / 0-1000 / 0-1000 / 0-2000 / 0-2000 (+1dB/-3dB)		Accelerometers: 0-300 / 0-1500 / 0-1800 / 0-1800 / 0-1800 (±1dB)
			Angular rate sensors: 0-1000 / 0-1000 / 0-1000 / 0-1000 / 0-2000 / 0-2000 (+1dB/-3dB)
Shock Limit (g)	5,000		
Typical Applications	Automotive safety and ATD testing, and other applications requiring accurate measurement of rotational velocity	Automotive and aerospace testing requiring pitch, roll and yaw measurement, automotive roll-over ATD head, chest and leg positions	Vehicle dynamics, aircraft flight testing, spacecraft and satellite, missile testing, and automotive testing

ANGULAR RATE RANGE APPLICATION GUIDE

RANGE	IDEAL FOR	APPLICATIONS	
100 deg/sec	Long events such as vehicle rollover, flight, automotive yaw/pitch/roll	Aerodynamic measurements Vehicle rolling/tipping Motorsport	
500 deg/sec	Off-road testing, RLDA/road load data, construction equipment testing	Autonomous vehicle development Road test, ride quality, chassis response HVOR testing Robotic motion	
1.5k deg/sec	Vehicle rotation during crash test (mounted between driver and passenger along transmission tunnel)	Automotive rollover Missile/rocket flight Shaker testing of small structures ATD's (Q3s Head) Rear impact testing	
6K and 8K deg/sec	Vehicle rotation during crash test (mounted between driver and passenger along transmission tunnel)	ATD's Car body motion during impact, Offset impact structure deformation Ejector seat testing Helmet Testing	
12K and 18K deg/sec	Calculating head injury criteria (HIC value)	ATD's THOR, & HIII WorldSID & Q series aPLI Pedestrian leg form impactor Free ejection head forms	

FILTERING RECOMMENDATIONS

RMS values in both mV and scaled deg/s
(without filtering higher peaks will be seen)

MEMS gyroscopes have modulated drive frequencies that can impose noise across the bandwidth of the gyro. Our gyroscopes have particularly high bandwidth, ideal for fast acting and impact applications. For relatively slow applications filtering can improve residual noise levels.

Here is a 100 deg/s gyro sampled at 10kHz and low pass filtered at 1kHz, 100Hz and 10Hz. Note the marked decrease in residual noise at each filter level.

RECOMMENDED ACCESSORIES

SIGNAL CONDITIONERS		
		
Model Number	PCB 482C27	PCB 483C28
Features	Bridge/differential, ICP®, voltage sensor signal conditioner	
Channels	4	8
Gain	x0.1 to x200 (ICP®, Volt) x0.1 to x2000 (Brdg/Diff)	
Frequency Range (+/-5% (gain <100))	0.05 Hz to 100 kHz	
Digital Control Interface	RS-232, Ethernet	Ethernet
Electrical Connector (Inputs)	BNC jack, 8-socket mini DIN	
Power Requirements (VAC)	AC	

TRIAxIAL AND 6DOF MOUNTING BLOCK

ENDEVCO MODEL 7930

- Accommodates three 7310A angular rate sensors and three 7264C, 7264D, 7264H or 726CH accelerometers

3425 Walden Avenue, Depew, NY 14043 USA
