** Variable capacitance accelerometers

Variable capacitance (VC) accelerometers are DC-response sensors for measuring low frequency vibration, motion (constant acceleration) and tilt. With gas damping and internal over-range stops, Endevco VC accelerometers are capable of measuring whole body motion immediately after being subjected to a shock motion, even in the presence of severe vibrational inputs and variable temperatures.

Piezoresistive accelerometers

Piezoresistive (PR) accelerometers are ideal for measuring impacts and shock events. Typical applications include automotive crash testing, commercial drop testing and high g weapons testing. These highly specialized MEMS sensing elements are micro-machined at the facility in Sunnyvale, California. Some units are damped to prevent ringing, while others are undamped to provide high bandwidth. Various packaging configurations are available to meet diverse mounting requirements.

Inertial sensors

Angular rate sensors measure relative rotational motion directly and provide an output in degrees per second. This measurement of angular velocity offers great improvement over the previous method of using three accelerometers and doing complex calculations. Multiple ranges are provided to enable measurement of slow or fast moving events.

Piezoresitive pressure sensors

Miniature piezoresistive pressure sensors measure both dynamic and static pressure in process control applications, blast testing, automotive airbag testing, rocket motor analysis, jet engine inlet pressure measurements, transmission testing and hydraulics measurements. A four-arm strain gage bridge MEMS sensing element, implanted into a sculpted diaphragm, offers a wideband frequency response with outstanding sensitivity for improved resolution, high resonance frequency, exceptional linearity, and reliable hysteresis performance.

Signal conditioners and supportive instrumentation

Endevco provides a comprehensive range of high-performance electronics, from simple battery-operated signal conditioners to computer-controlled, laboratorygrade instrumentation. These devices are compatible with Endevco's IEPE, PE, VC, and PR accelerometers and pressure sensors, as well as other commonly used industry models.

Piezoelectric accelerometers

Piezoelectric (PE) accelerometers are charge-mode accelerometers that require the use of an external charge amplifier. This allows for long term, reliable operation over wide temperature and amplitude ranges. These accelerometers are ideal for use in extreme environment conditions, from cryogenic to extreme-high temperatures and in radiation environments. They are offered in a wide variety of sizes and configurations.

申 IEPE accelerometers

Integrated electronics piezoelectric (IEPE) accelerometers feature an integral electronic charge converter. Integrated electronics eliminate the need for in-line amplifiers and specialty cable.

High intensity microphones

Piezoelectric microphones measure high-intensity acoustic noise parameters and very low pressure fluctuations. Hermetically sealed units operate over a wide temperature range and are insensitive to altitude changes and ambient vibration.

Cable assemblies

For optimal performance, Endevco relies upon in-house expertise to design and manufacture its own cables and connectors. Standard and custom assemblies include low-noise, high-temperature, and multi-conductor options. .

There is more than one type of accelerometer!

Endevco designs and manufactures a variety of accelerometers for measurements of vibration, shock and inertial motion. To meet various testing requirements, several types of accelerometer technologies are available each differing in terms of their recommended usage, performance specifications, power requirements and signal conditioning characteristics. The following is a general overview of accelerometer technology types and their application considerations.

Piezoelectric (PE) accelerometers

All mechanical accelerometer designs are based on a simple spring-mass principle in which strain is generated in relation to amplitude and frequency of the dynamic motion. In a piezoelectric (PE) accelerometer, this strain is applied directly to the PE element, which develops an electrical charge proportional to mechanical motion. Different material and configurations of PE accelerometer elements are used to support specific applications.

Advantages of PE sensors

- The dynamic range of PE accelerometers can be greater than 130dB. When used with a proper charge converter/amplifier, they offer unmatched performance in terms of total measurement range and reliability. Transduction efficiency may also be optimized with PE crystals to allow for the miniaturization of accelerometer within a given physical envelope.
- Single-ended compression types are optimal for low-level measurements due to the high sensitivity achieved by stacking multiple PE crystals in parallel.
- A shear mode design allows for the construction of miniature, lightweight sensors suitable for monitoring small components and test articles.
 A key advantage of the shear design is the isolation of the sensing element from the base, which provides excellent protection from base strain and

- Due to the broad temperature range of most piezoelectric materials, PE accelerometers are often specified for extreme high or low temperature applications, from cryogenic conditions in rocket engines to the extreme heat environment of a turbine generator.
- PE accelerometers are available in a wide range of shapes and sizes, from micro-miniature in electronics component testing to larger sizes used in seismic or engine applications.

Piezoresistive (PR) accelerometers

Strain gauge accelerometer designs based on a Wheatstone bridge arrangement consist of a rugged monolithic assembly with solid-state MEMS resistors that change in resistance in proportion to applied mechanical strain.

Advantages of PR sensors

- PR accelerometers feature DC response, making them suitable for measuring long-duration pulses.
 Their acceleration outputs can be integrated to accurately determine velocity and displacement.
- Monolithic MEMS sensors exhibit high sensitivity with an excellent signal-to-noise ratio and outstanding stability.
- The simplicity and miniature size of the MEMS PR element enable broad bandwidth (>100,000 Hz) and wide dynamic range (>100,000 g) designs.

4

temperature transients.

Integrated electronics piezoelectric (IEPE) accelerometers

The acronym IEPE refers to a type of piezoelectric (PE) accelerometer with internal electronics (IE) that allows it to convert charge to a low-impedance voltage output. Its temperature response is somewhat limited due to its onboard electronics. This type of accelerometer is primarily specified for applications in which environmental conditions permit its use, including HALT/HASS/ESS testing, industrial vibration monitoring, and general-purpose vibration and shock testing.

Since both PE and IEPE types are AC-coupled designs, the acceleration output of these accelerometers cannot be used to yield correct velocity and displacement information by numerical integration.

Advantages of IEPE sensors

- Less operator attention, training and installation expertise required.
- Uses standard coaxial cable.
- Drives long cables without noise increase or loss of resolution.
- Operates directly into many data collectors with built-in constant current input.

Variable capacitance (VC) accelerometers

Endevco's VC accelerometers feature a silicon MEMS capacitive sensing element, anodically bonded to a lid and base to create a parallel-plate differential capacitor. They provide DC response, gas damping for broad frequency coverage, and rugged construction for reliable performance. Integrated electronics with DC excitation ensure a stable, high-level, lowimpedance output signal.

Advantages of VC sensors

- Designed for low-g measurement, yet can also withstand very high g shocks.
- Suitable for trajectory monitoring, modal analysis, flutter testing, and vehicle dynamics measurements, including automotive suspensions and ride quality.

Accelerometer Performance Characteristics

To obtain meaningful acceleration data, it's essential to understand the performance characteristics of the accelerometers being used.

Parameters include:

Sensitivity

Higher sensitivity typically results in a higher signal-to-noise ratio. Interfering electrostatic and electromagnetic noise will be less bothersome with a higher-sensitivity device. Higher sensitivity, however, may bring two disadvantages: greater accelerometer mass and a lower resonance frequency.

Low-frequency response

With a PE accelerometer, the low-end response can only be assessed together with the charge converter as a system. With IEPE sensors, the charge converter is built into the sensor, which has a preset low frequency cutoff. The cutoff in a typical charge converter is often set at 1 to 5 Hz to reject any pyroelectric output. PR and VC accelerometers offer DC response and have no roll-off characteristics at low frequency.

Temperature sensitivity

Accelerometer sensitivity varies with temperature. Many models are optimized for stable sensitivity over a wide temperature range. Typically, the higher the temperature, the higher the degree of measurement error potential, unless compensated. Temperature sensitivity compensation can be passive (using capacitors and resistors) or active (using ASICs), each with its own advantages and disadvantages in implementation.

Transient temperature effects

Compression-mode PE and IEPE accelerometers may produce output signals during rapid temperature changes, known as pyroelectric output. This problem has been virtually eliminated with the advent of shear mode accelerometers (most Endevco accelerometers are shear mode types). Thermal transient response errors tend to manifest themselves as low frequency signals and often go undetected. PR and VC devices have no significant response to rapid temperature changes.

High-frequency response

This is a function of both mechanical characteristics and the method used to attach the device. Most accelerometers exhibit an undamped single degree-of-freedom response when securely mounted. Response is relatively flat, to about 20% of the mounted resonant frequency. Correction factors can be derived for data obtained at higher frequencies. Electronic filtering can increase flat response to 50% of the mounted resonant frequency.

Transverse sensitivity

Also referred to as crosstalk, transverse sensitivity describes the sensor's ability to minimize responses to motion applied along lateral axes. Endevco sensors achieve exceptional performance, limiting sensitivity to lateral motion to less than 5% of the primary axis sensitivity.

Amplitude linearity

PE accelerometers have a predictable nonlinearity that can be expressed as a percentage increase in sensitivity as acceleration increases, such as 1% per 500 g. The upper limit can be determined and expressed for each model. With most Endevco PE and PR models, the output of the device can still be usable at two to three times its rated full scale range if the higher non-linearity is acceptable to the application.

Strain effects

The test item may flex, stretch, or bend at the point where an accelerometer is mounted, causing it to produce an erroneous output due to the deformation. The situation may be improved by using mounting adapters but at the expense of reduced transmissibility. Shear type PE/IEPE accelerometers are much less sensitive to such errors than conventional compression types. The output of PR and VC types are less susceptible to strain effect in general.

Mass loading

Frequency response of the unit under test can be appreciably changed if the dynamic mass of the accelerometer approaches the dynamic mass of the test article. Consequently, it is recommended to use an accelerometer which weighs no more than 10% of the unit under test.

Damping

Most commonly used accelerometers are undamped, making them susceptible to resonance in applications involving mechanical impacts. When an accelerometer resonates, it runs a risk of amplifier overload, offset error, or even damage to the device. A more suitable approach incorporates damping such that high frequency content above the passband of interest is directly mitigated. Certain PR and VC sensor use gas damping built into the sensing element design to control resonance.

7

APPLICATION

Automotive Design & Test

Endevco has sensors for all your automotive development applications. Our IEPE accelerometers are best for vehicle dynamic testing of engines, exhaust systems, and other components due to their miniature packaging, high temperature performance and rugged construction. Endevco VC accelerometers feature high stability, low frequency measurement suited to suspension and ride quality testing. Our PR pressure sensors are ideal for testing automotive systems such as Anti-Lock Brake Systems (ABS), transmissions, fuel systems, and oil systems due to their wide frequency response and miniature, high-output design.

Applications

- Road load
- Powertrain
- Transmission testing
- Modal/chassis design
- Component qualification testing
- Noise, Vibration, and Harshness (NVH)

- TEDS enabled for high channel count applications
- Static and dynamic pressure measurements
- Miniature size

8510B	Pressure sensor in high and low ranges for automotive development	<u>27</u>

Automotive Safety Testing

Since the earliest days of vehicle safety testing, Endevco has collaborated with OEMs, test laboratories, and ATD manufacturers' design and test personnel to ensure precise measurements for front, side, and rear impacts, crush zones, in-vehicle occupant safety, and pedestrian protection. Endevco's high-precision, DC-responding piezoresistive accelerometers are widely used in these applications due to their high output, low mass, and compact design, making them suitable for mounting in challenging locations. Their durability, miniature size, and DC response capabilities provide reliable solutions for a wide range of automotive testing needs.

Applications

- Anthropomorphic Test Device (ATD)
- Pedestrian safety study
- Frontal, rear and side impact
- Vehicle roll-over testing
- Global regulatory compliance testing
- Vehicle crush zones and crash sleds

- SAE J211, J2570 and ISO 6487 compliant
- Standard equipment on all ATDs
- Exceptional frequency response
- Small and lightweight
- Rugged to 10,000g
- Multi-mode damping

Aircraft / Spacecraft Design & Test

As the leading sensor provider for development and flight test of aircraft and spacecraft, Endevco's advanced measurement devices are proven to withstand the challenges of extreme environments. Our accelerometers, pressure sensors and electronics are trusted solutions used in hundreds of flight tests worldwide, delivering industry-leading performance and reliability for several decades.

Applications

- Flutter testing
- Turbulent airflow measurements
- Rocket engine testing
- Vibroacoustic testing
- Vehicle dynamics studies
- Missile and rocket launches

- Cryogenic temperatures (-452°F, -269°C)
- Flight / space qualified electronics

High g Shock Testing

Endevco's high g accelerometers have long been the industry standard for reliable shock measurements in extreme environments. Our piezoresistive accelerometers provide DC response with minimal zero shift to avoid integration errors, which is critical to the quality of your measurements. Advanced in-house MEMS technology enables a compact design, high sensitivity, and exceptional over-range performance, while ensuring the repeatability and reliability needed for mission-critical applications. Our newest generation of gas-damped accelerometers are the most survivable in the world. They are available in single-axis or triaxial configurations with multiple mounting options, including screw, stud, and surface mounts, and are fully SMT compatible.

Applications

- Weapons and rocket testing
- High-shock data recorders
- Shock wave monitoring
- Drop and impact testing
- Portable electronic device testing
- Near- and far-field pyroshock testing
- Fuze/safe and arm
- Mechanical shock testing

- Undamped for broad frequency response or damped for exceptional survivability
- Multiple mounting configurations
- Minimal zero shift after shock
- High survivability in overrange environments
- DC response for long duration transient events
- Ranges up to 200,000 g
- Miniature SMT versions for embedded applications

Pressure Testing

Endevco's miniature piezoresistive pressure sensors offer accurate and reliable performance at pressure extremes. For several decades, Endevco's pressure sensors have been addressing demanding test environments for automobiles, trains, aircraft and weapons. The MEMS sensing elements are designed for extremely high output and high resonance combined with exceptional linearity and hysteresis performance. Whether your application calls for measurement of 1 psi or 20,000 psi, a light wind or an explosive blast, Endevco has a pressure sensor that will give you the data you need.

Applications

- Hypersonic, transonic and "quiet flow" wind tunnel testing
- Blast testing
- Automotive airbag inflation testing
- Jet airflow fields and inlet pressure
- Rocket acoustics
- Turbulent airflow measurements
- Vehicle transmission testing
- Hydraulics measurements

- Gage and absolute models
- High sensitivity for better signal-to-noise ratio
- High resonance frequency for fast response time
- Industry leading over-range (3x) and burst pressure
- Excellent linearity (to 3x full scale on some models)
- Insensitive to vibration
- Many special modifications available including metric threads, integral connectors, and special protections against humidity or photo-flash

Variable Capacitance Accelerometers

Applications

- Aircraft flight and flutter testing
- Automotive ride quality testing
- Train ride quality testing
- Engine load cycle
- Road Load Data Acquisition (RLDA)

Variable capacitance (VC) accelerometers

Endevco's VC accelerometers incorporate a silicon MEMS capacitive sensing element, anodically bonded to a lid and base to form a parallel-plate differential capacitor. They offer DC response, gas damping for broad frequency coverage, and rugged construction. Integrated electronics with DC excitation deliver a stable, high-level, low-impedance output signal.

Advantages of VC sensors

- Designed for low-g measurement, yet can also withstand very high g shocks.
- Suitable for trajectory monitoring, modal analysis, flutter testing, and vehicle dynamics measurements, including automotive suspensions and ride quality.

Inertial Sensors

Applications

- Vehicle dynamics
- Automotive rollover
- Whiplash
- Aircraft flight testing
- Spacecraft and satellite
- Motion studies

In typical dynamic measurements, both acceleration and angular rate data are essential parameters needed to fully characterize the complex behavior of a moving object. Until recently, engineers primarily relied on linear accelerometers, as collecting rotational data required large arrays of sensors that were impractical due to cost and space constraints. With Endevco's new angular rate and six-degree-of-freedom (6DoF) sensors, professionals in automotive and aircraft development can measure both linear and rotational dynamics using fewer sensors and less space. Instead of relying on assumptions about these dynamic interactions, these analog-output sensors deliver reliable, empirical data to validate analytical results. What makes our sensors truly unique is that we offer the low acceleration ranges and low angular rate ranges that are most suitable for accurately characterizing motion.

Shock limit g	5000
Operating temperature °C (°F)	-40 to +105 (-40 to +221)
Dimensions mm (in)	20.3 x 20.3 x 12.4 (0.80 x 0.80 x 0.49)
Weight grams	9
Rate excitation voltage Vdc	5 to 16
Mounting method	2-56 screws

Model number	7360A
Description	6DoF measurement Compact package with 2 cables Rugged to 5000 g shocks
Accelerometer ranges g	±2 / ±10 / ±50 / ±200 / ±500
Range deg/sec	±100 / ±500 / ±1,500 / ±6,000 / ±8,000 / ±12,000 / ±18,000
Accelerometer sensitivity mV/g typical	1,000 / 200 / 40 / 10 / 4
Sensitivity mV/g/sec +/-15%	20 / 4 / 1.333 / 0.25 / 0.167 / 0.111
Accelerometer frequency response +/-1dB	0-300/0-1,500/0-1,800/0-1,800/0-1,800
Frequency response Hz +1/-3dB	0-1,000 / 0-1,000 / 0-1,000 / 0-1,000 / 0-2,000 / 0-2,000
Non linearity % FS0	0.5
Shock limit g	5,000
Operating temperature °C (°F)	-40 to +100 (-40 to +212)
Dimensions mm (in)	30.5 x 30.5 x 27.9 (1.2 x 1.2 x 1.1)
Weight grams	35
Accelerometer excitation voltage Vdc	7 to 36 or 5V (M1 option)
Rate excitation voltage Vdc	5 to 16
Mounting method	4-40 screws

Piezoresistive Pressure Transducers

Applications

- Jet airflow fields and inlet pressure
- Hypersonic, transonic and "quiet flow" wind tunnel testing
- Turbulent airflow measurements
- Blast testing
- Automotive airbag inflation testing
- Rocket motor analysis
- Vehicle transmission testing
- Hydraulics measurements

Miniature piezoresistive pressure transducers are designed to measure both dynamic and static pressure to a high degree of accuracy. Their MEMS sensing elements incorporate a unique diaphragm design, manufactured at Endevco's U.S.-based MEMS facility. This results in pressure sensors with extremely high output signals, high resonant frequencies, exceptional linearity, outstanding repeatability, and virtually no hysteresis.

All models feature internal temperature compensation to provide stable performance over temperature. Absolute pressure sensors are available in ranges as low as 0–15 psia and as high as 0–2,000 psia, with gage/differential sensor models available in ranges as low as 0–1 psig and as high as 0–20,000 psig. All units are shipped in specially designed electrostatic discharge (ESD) packaging to reduce the potentially harmful effects of static electricity on critical components, as well as to further support customer in-house ESD control procedures.

Piezoelectric Accelerometers

Applications

- Satellite
- Turbine development
- HALT & HASS testing
- Quality assurance
- Nuclear power plant monitoring
- Cryogenic testing
- Automotive engine testing

Piezoelectric (PE) accelerometers

All mechanical accelerometer designs are based on a simple spring-mass principle in which strain is generated in relation to amplitude and frequency of the dynamic motion. In a piezoelectric (PE) accelerometer, this strain is applied directly to the PE element, which develops an electrical charge proportional to mechanical motion. Different material and configurations of PE accelerometer elements are used to support specific applications.

Advantages of PE sensors

- The dynamic range of PE accelerometers can be greater than 130dB. When used with a proper charge converter/amplifier, they offer unmatched performance in terms of total measurement range and reliability. Transduction efficiency may also be optimized with PE crystals to allow for the miniaturization of accelerometer within a given physical envelope.
- Single-ended compression types are optimal for low-level measurements due to the high sensitivity achieved by stacking multiple PE crystals in parallel.
- A shear mode design allows for the construction of miniature, lightweight sensors suitable for monitoring small components and test articles. A key advantage of the shear design is the isolation of the sensing element from the base, which provides excellent protection from base strain and temperature transients.
- Due to the broad temperature range of most piezoelectric materials, PE accelerometers are often specified for extreme high or low temperature applications, from cryogenic conditions in rocket engines to the extreme heat environment of turbine generators.
- PE accelerometers are available in a wide range of shapes and sizes, from micro-miniature in electronics component testing to larger sizes used in seismic or engine applications.

IEPE Accelerometers

Applications

- Aircraft flight testing
- Ground vibration testing
- Modal analysis
- Quality assurance
- Product R & D
- · Heavy machinery maintenance
- Powertrain development
- OEM design and test applications

Integrated electronics piezoelectric (IEPE) accelerometers

The acronym IEPE refers to a type of piezoelectric (PE) accelerometer with internal electronics (IE) that allows it to convert charge to a low-impedance voltage output. Its temperature response is somewhat limited due to its onboard electronics. This type of accelerometer is primarily specified for applications in which environmental conditions permit its use, including HALT/HASS/ESS testing, industrial vibration monitoring and general purpose vibration and shock testing.

Since both PE and IEPE types are AC-coupled designs, the acceleration output of these accelerometers cannot be used to yield correct velocity and displacement information by numerical integration.

Advantages of IEPE sensors

- Less operator attention, training and installation expertise required.
- Uses standard coaxial cable.
- Drives long cables without noise increase or loss of resolution.
- Operates directly into many data collectors with built-in constant current input.

Signal Conditioners

Configurations

- Bench top
- Rack mounted
- In-line, remote
- Airborne installation
- Battery operated

Endevco provides a comprehensive range of high-performance electronics, from simple battery-operated signal conditioners to computer-controlled, laboratory-grade instrumentation. These devices are compatible with Endevco's IEPE, PE, VC, and PR accelerometers and pressure sensors, as well as other commonly used industry models.

High Intensity Microphones

Piezoelectric microphones measure high intensity acoustic noise and very low pressure fluctuations over a frequency range of 1 Hz to 10 kHz with a measurement range of 100 to >180 dB SPL. These hermetically sealed microphones are designed for operation in harsh environments and operate over a temperature range of -55°C to +260°C (-67°F to +500°F). Other outstanding features include insensitivity to altitude changes and ambient vibration.

Cable Assemblies

Endevco designs and manufactures many of its own cables and connectors, specializing in custom configurations, lengths, and connectors for dynamic testing applications. In tough and challenging environments, accuracy relies as much on cables and connectors as on transducers. Our engineers understand the critical design parameters that affect signal transmission and carefully optimize them to ensure superior data quality and reliability. With this level of in-house custom capability, ordinary commercial cable and transducer providers simply can't compare.

Accessories

Endevco manufactures a complete range of accessories designed and fully tested to be directly compatible with our sensors, transducers and related instrumentation. To ensure high-reliability sensor performance and repeatable results, appropriately selected mounting studs, blocks, bases, adapters and other accessories are highly recommended. These tools ensure proper sensor attachment to the test structure or mounting surface, minimizing additional mechanical stress and optimizing frequency response. When selecting an accessory for a specific measurement requirement, it is essential to follow proper sensor mounting techniques and ensure the mounting surface is correctly prepared, as both are critical to achieving accurate results.

Calibration Services

Features

- Full range of sensor calibration services available
- Comprehensive calibration reports
- A2LA accredited, National Metrology Institute traceable
- Custom calibration services available
- Fast turnaround

Endevco offers comprehensive calibration services to ensure sensors maintain a high level of precision and accuracy. A variety of calibration options are available, including absolute vibration calibration for the lowest uncertainty, and comparison techniques for shock and vibration. Endevco also provides customized calibrations, such as environmental calibrations to verify amplitude linearity or frequency, and high-shock impact testing. Our calibration team is dedicated to delivering the most accurate calibrations, conforming to standards set by National Metrology Institutes (NMI) such as NIST or PTB. All calibration services are A2LA accredited.

What we calibrate

- Piezoelectric accelerometers (PE and IEPE)
- Peizoresistive accelerometers
- Variable capacitance accelerometers
- Pressure transducers
- Both Endevco and non-Endevco transducers
- System calibration (sensor + amplifier/signal conditioner)

Annual calibration is recommended for accelerometers and their associated instrumentation to ensure the continued accuracy of your dynamic measurements. At Endevco, calibration is performed by the same experts who design, build, and calibrate hundreds of accelerometers daily. Our qualified technicians, supervised by experienced engineering staff, ensure precise and reliable results. Endevco offers a wide selection of calibration services, including simple back-to-back calibrations and highly accurate absolute calibrations to meet diverse requirements.

For those requiring the highest levels of reporting, we offer comprehensive calibration reports that include detailed descriptions of the methods used, reference standards and their current calibration dates, report numbers, and traceability to National Metrology Institutes (NMI), such as NIST or PTB. The reports also provide estimated calibration uncertainties, environmental conditions (temperature and humidity) during calibration, measurement data points, and a graphical display of output data. For faster service, a standard one-page calibration certificate with essential details is also available.

For vibration services, Endevco uses precision, lownoise air-bearing shakers with a beryllium armature to ensure exceptional accuracy and high-frequency capabilities. We also perform resonance searches to assess the sensor's condition. Endevco-designed equipment is used to test cross-axis sensitivity, a critical measure of accelerometer performance. For shock services, Endevco equipment enables testing up to 100,000 g.

What we do

When we receive your sensor, it undergoes a full inspection and testing process. If the sensor is found to be operating properly, we will proceed with the requested calibration. If any issues are identified during inspection or testing, we will inform you of repair or replacement options. Should repairs not be possible, we can offer an attractive trade-in opportunity for a new Endevco product. For further assistance or to discuss alternative options, please contact your local representative.

Traceability and accreditation

Accelerometer calibrations are conducted in our A2LA accredited laboratory. The methods used are in accordance with ANSI/NCSL Z540-1-1994 and ISO/IEC 17025-2005. Traceability to the National Metrology Institute (NMI: NIST, PTB, etc.) is shown as required by military quality control standards.

Calibration Services

Primary calibration with frequency sweep

Primary Calibration by Laser Interferometer. Includes frequency sweep in the specified range below.

Calibration service number	CS120A	CS120AH	CS120AL	CS120ALH	CS120AS	CS120ALH-S	CS120ALS
Frequency range	20 Hz to 10 kHz	20 Hz to 20 kHz	1 Hz to 10 kHz	1 Hz to 20 kHz	20 Hz to 10 kHz	1 Hz to 20 kHz	1 Hz to 10 kHz
System cal ³	No	No	No	No	Yes	Yes	Yes
Transverse sensitivity	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Report/certificate ¹	Full report	Full report	Full report	Full report	Full report	Full report	Full report
Capacitance Measurement	Yes	Yes	Yes	Yes	Yes	Yes	Yes

Primary calibration, single point

Primary Calibration by Laser Interferometer. Measurement taken at a single frequency, customer defined.

Calibration service number	CS120B
Frequency range	Single Frequency
System cal ³	No
Transverse sensitivity	Yes
Report/certificate ¹	Full report
Capacitance Measurement	Yes

Comparison calibration

Secondary calibration by comparison provides a measurement uncertainty of \pm 1.2 % (100 Hz), \pm 1.5 % (20 Hz to 2500 Hz), \pm 2.5 %. (>2500 Hz to 10,000 Hz), and 5 % (>10,000 Hz).

Calibration service number	CS130	CS130H	CS130L	CS130LH	CS130S	CS130LH-S

Calibration Services

Shock calibration

Half-sine shock calibration by comparison provides a measurement uncertainty of ± 1.9 % (20 to 2000 g) and 2.7% (2000 to 10,000 g).

Calibration service number	CS110	CS110S	CS220	CS111	CS115
Shock range	20 g to 10 Kg, 5 levels	20 g to 10 Kg, 5 levels	20 g to 10 Kg, 5 levels	10 Kg to 100 Kg, 5 levels	10 Kg to 100 Kg, 5 levels
Frequency range ⁷	20 Hz to 10 kHz	20 Hz to 10 kHz	NA	NA	NA
System cal ²	No	Yes	No	No	No
Transverse sensitivity	Yes	Yes	Yes	Yes	No

Environmental calibration

Sensitivity calibration at temperature.

Calibration service number	CS310	CS315
Description	Sensitivity measurement at single frequency, at customer specified temperature	Sensitivity measurement at single frequency, at customer specified temperature
Temperature range °C (°F)	-55 to +175 (-67 to +345)	-55 to +175 (-67 to +345)
Transverse sensitivity	No	Yes

- 1. Full report includes a 5+ page comprehensive report. Standard Cert includes a 1 page calibration certificate
- 2. Resonance search is performed up to 50,000 Hz or the sensor's highest specification frequency
- 3. System cal performs the calibration procedure on the measurement system including a transducer and its associated cable and signal conditioning
- 4. For triaxial accelerometers
- 5. Includes TEDS (Transducer Electronic Data Sheet) verification and update
- 6. Amplitude linearity (5 g levels from 1 g to 100 g, specified by customer)
- 7. Includes standard frequency sweep
